

Multifunctional control with permanent open function set via radio signal

Description

In the course of our ongoing product optimisation, we have added a convenient function to our multifunctional controls for **autotronic 834/836**. It is now possible to activate the permanent open function via radio signal.

Until now a realisation of the permanent open function was available over wired external buttons, or buttons that were integrated in the control. Thanks to the new control firmware this can now also be set wireless via radio. With a simple touch of a button via radio keys or also with other radio access controls, like for instance FUHR fingerprint scanner. With SmartConnect easy the desired function can be controlled particularly comfortable via app – even automated with stored time profiles.

With the set function the LEDs on the control provide information with help of flashing signals (the green LED flashes slowly).

Application example

Entrance doors to medical practices, shops, or small business objects have special demands regarding the opening hours and the corresponding control of access. Therefore, the motorised locks **autotronic 834/836** allow, among other things, the realisation of intelligent locking options, like for instance to stop the complete locking temporarily.

For this purpose, the permanent open function is available. During the day, the latch and all bolts are permanently retracted. This allows unhindered opening of the door from both sides – without access control.

Date/market launch

The new function has already been included as standard in all **autotronic** controls since January 2021.
